Test Strategy Document

ShopLC-de:

1.Objective

The objective of this document is to define the high-level testing approach for an e-commerce platform, ensuring quality, reliability, and compliance.

Application:

The application under test is an Shop-LC Germany is an E-Commerce application developed in salesforce commerce cloud which is mainly specialized in selling jewellery. The network is a subsidiary of the Indian-based Limited. The application has different modules and the Product list are stored in sales force Business Manager.

Modules Covered

- Product Listing Page (PLP)
- Product Detail Page (PDP)
- Auctions Module
- Live TV Shopping
- Wishlist
- Checkout & Order Management
- Payment Systems (AutoPay, Budget Pay, Normal Pay)
- Using another upstream application called AMS (Auction Management Services) Promotions, Shipping Methods, and Email triggered, Coupons, Fast Buy, Chat with us, are handled

2. Scope

In Scope:

- Product Listing Page (PLP)
- Product Detail Page (PDP)
- Auctions & Live TV Shopping
- Wishlist
- Cart & Checkout
- Payment (AutoPay, Budget Pay)
- Order Management

- GDPR Compliance

Out of Scope:

- Third-party system internal logic
- External payment gateway internals

3. Test Approach

Testing will include:

- Functional Testing
- Integration Testing
- End-to-End Testing
- Regression Testing
- API Testing

Test Areas

- Product browsing and search functionality
- Auction participation and bidding flow
- Live TV shopping interaction
- Cart operations and checkout flow
- Payment processing scenarios
- Order lifecycle validation

4.Test Types

The following test types will be performed:

- Functional Testing
  Core functionalities such as login, product browsing, cart, and checkout will be tested.
- Integration Testing
  Interaction between modules such as cart, payment, and order management will be validated.
- End-to-End (E2E) Testing
  Complete user journeys from product selection to order confirmation will be tested.

- Regression Testing
  Existing functionalities will be re-tested after every release cycle.
- API Testing
  Backend services will be validated using tools like Postman to ensure correct data exchange.
- Performance Testing (High-Level)
  System behavior under load (e.g., auctions, live shopping events) will be assessed.
- Security Testing
  Authentication, authorization, and payment data protection will be verified.
- Compliance Testing
  Application will be validated against GDPR requirements such as consent and data privacy.
- Usability Testing
  User interface and navigation will be evaluated for ease of use.

5. Risk-Based Testing

High-risk areas:

- Payment processing
- Auction timing and bidding
- Order creation failures

Mitigation:

- Prioritized regression
- Focused test coverage
- Continuous monitoring

6. Compliance Testing

The system will be tested for:

- User consent management
- Data privacy and protection
- User data access and deletion
- Compliance & Security Testing

- Application behaviour against GDPR requirements should be validated
- Defect Management
- Logg and track defects using JIRA
- Worked closely with development teams for quick resolution
- Retesting and regression should be performed

5. Test Environment

- **QA Environment**
- **Staging Environment**
- **Integrated systems for catalog and upstream data**

6. Entry Criteria

- **Requirements finalized and approved**
- **Build deployed to QA environment**
- **Test data available**

7. Exit Criteria

- **All critical and high-priority test cases executed**
- **No open critical defects**
- **Stakeholder sign-off obtained**

8. Resource Planning

- **QA Team (Manual & Automation)**
- **Development Team**
- **Business Analysts**

9. Schedule

- **Test Planning**

- Test Design
- Test Execution
- Regression Testing

10. Risk & Mitigation

Risk	Mitigation
Payment failures	Focused testing & multiple scenarios
Auction timing issues	Time-based validation
Integration issues	End-to-end testing

11. Deliverables

- Test Strategy & Plan Document
- Test Cases
- Defect Reports
- Test Exit Report
